

ORFA VISSEER, FOR 100 YEARS AN ESTABLISHED NAME IN METALWORKING

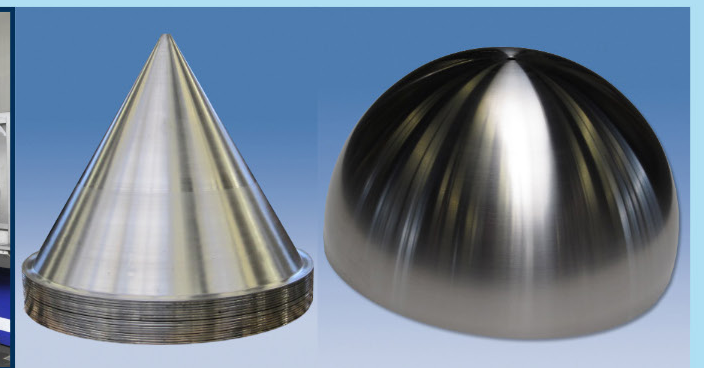

ABOUT US

Orfa Visser operates on a 20,000 m² company site, equipped with a modern and extensive machinery fleet. Here, we manufacture precision-engineered, high-quality semi-finished metal products. For over a century, we've been active in a wide range of industries, including climate control, the food industry, and the agricultural sector.

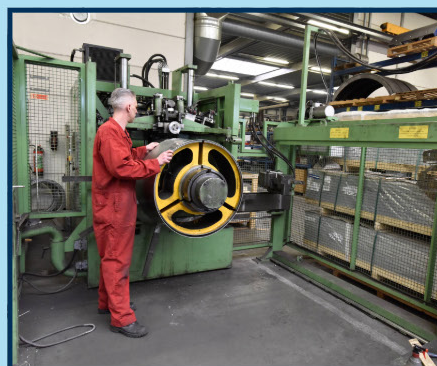

SPINNING

Metal spinning allows for seamless, precise shaping of round components from small parts like thimbles to large tank or silo bottoms. We can achieve diameters of up to nearly three meters, delivering high accuracy for both small and large projects.

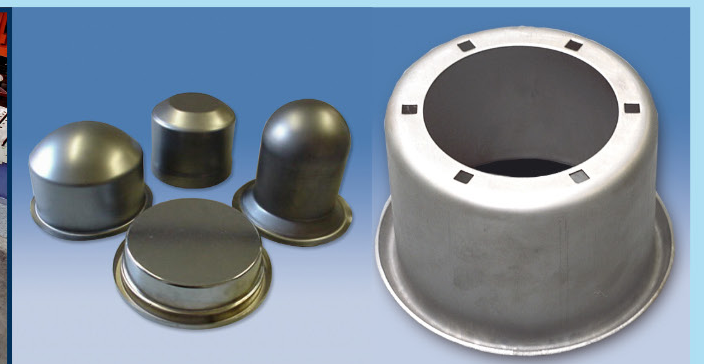

FLANGING

Our flanging process uses advanced machines to produce flanges and nozzles with high precision. These are applied to rolled and welded shells, used in systems such as ventilation technology, inlet and outlet cones, and various metal reducers and connectors. We ensure a high standard of quality and durability in every product we manufacture.

DEEP DRAWING

Deep drawing is an efficient press-forming technique for creating seamless metal products. It's suitable for various metals and provides flexibility in shaping intricate forms. Orfa Visser specializes in this process, with presses up to 400 tons and automated robotic feeding and unloading systems. This method allows for the production of complex shapes with minimal material waste.

ORFA VISSER, FOR 100 YEARS AN ESTABLISHED NAME IN METALWORKING

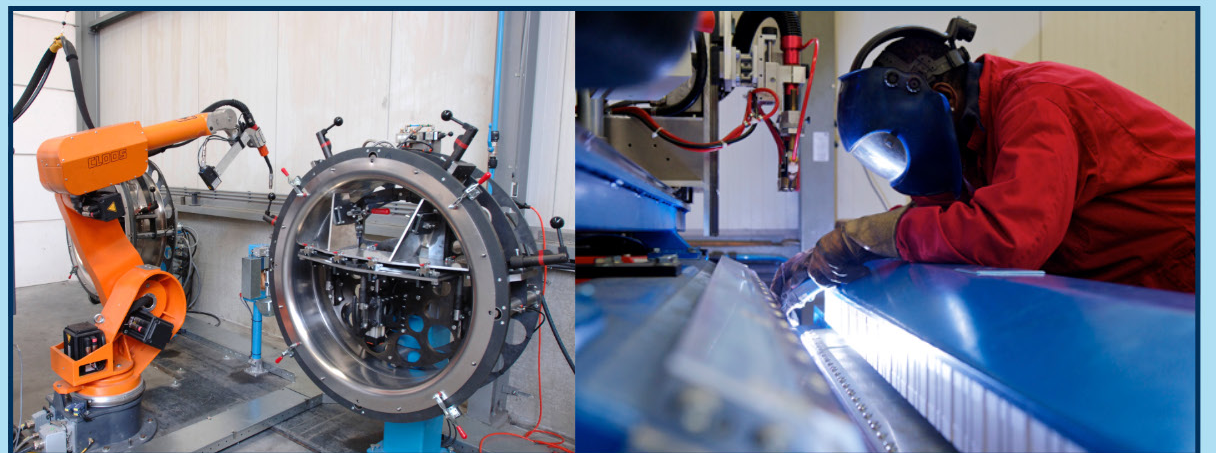

3D LASER CUTTING

With this advanced technique, we cut complex three-dimensional shapes from steel, stainless steel, and aluminum with exceptional precision. The process ensures fast, clean and accurate results, often eliminating the need for additional finishing steps. Thanks to its high flexibility, custom-made solutions can be developed quickly and efficiently, even for highly specific or demanding industrial applications.

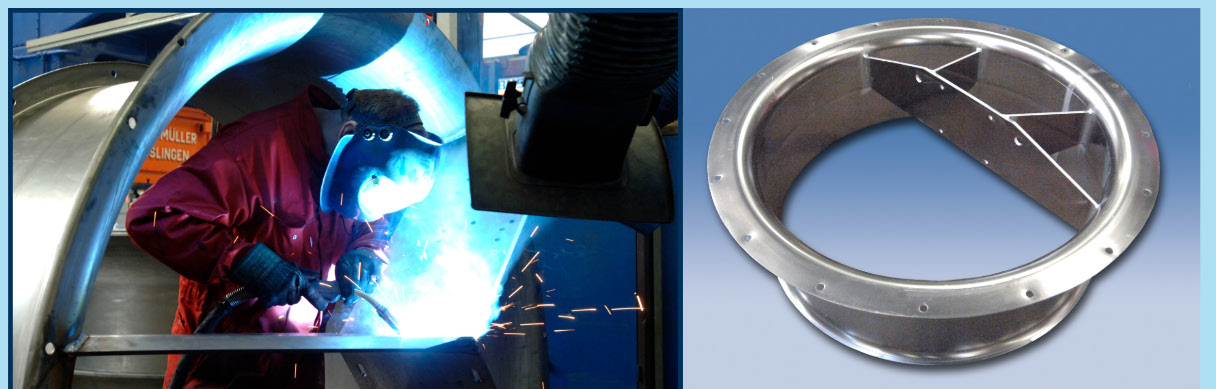

WELDING

Welding is one of the many metalworking services available at Orfa Visser. While traditional welding remains extremely versatile and adaptable, robotic welding offers excellent consistency and is ideal for smaller series with repeating patterns. It also brings important advantages such as speed, precision and improved process control, which contribute to efficient, reliable and high-quality production.

ASSEMBLED PRODUCTS

By combining multiple techniques like welding, deep drawing, flanging, and metal spinning, we manufacture complete, tailor-made assemblies. These products are engineered to meet specific customer requirements and are used in diverse sectors, from mechanical engineering to air handling and ventilation systems.
